

SetuCredit

Your records are already a credit history.

Voice-first DPI bridge from unbanked micro-borrowers to lenders - live demo

Consent first - Pass-through by default - Data never stored

THE PROBLEM

Crores of Indian households borrow with no bureau file.

- Land, electricity bills and bank activity prove creditworthiness - but lenders can't see them.
- Paper onboarding takes weeks, agents, and repeated document submission.
- Borrowers fear data misuse - and they are right to: consent is usually a checkbox.

THE SOLUTION

A 5-step bridge: voice onboarding to lender-ready score in ~2 minutes.

6

languages, UI + voice
(Hindi, Bengali, Tamil,
Telugu, Marathi, English)

4

DPI sources pulled
in parallel
(land, power, bank, ULI)

0

borrower records
persisted -
pass-through only

100

point Borrower
Readiness Index
scored per appraisal

Step 1: language-first onboarding

 **SetuCredit**

VOICE-FIRST · DPI-POWERED

Your records are already a credit history.

Land ownership, electricity bills and bank activity say more about a borrower than a bureau file ever could. SetuCredit turns them into a Borrower Readiness Index a partner lender can act on — with your consent, in your language, in minutes.

Consent first

Data never stored

+ 6 languages

Get started

Choose your language

English

Start onboarding

Takes about two minutes. Keep your Aadhaar-linked phone handy.

HOW IT WORKS

Four steps, one bridge to a lender

 **Speak or type in your language**
Six Indian languages, guided one step at a time.

 **Verify once with an OTP**
Sent to your Aadhaar-linked number and checked in seconds.

 **Consent, then and only then**
Tick exactly what you share. Consent expires on its own.

 **Get your Borrower Readiness Index**
Passed straight to a partner lender — funds arrive by UPI/IMPS.

Pass-through by design — borrower records are never written to our platform

Step 5: lender-actionable BRI report

Compliance is enforced in code, not by convention.

- Consent before data: every DPI pull needs active, revocable consent (HTTP 403 gate).
- Pass-through: Postgres keeps audit metadata only; Redis keeps TTL sessions. OTPs stored hashed, 5-attempt cap.
- HMAC-signed webhooks both ways; disbursal callback flips appraisal to 'disbursed'.
- SetuCredit never touches money: NBFC disburses over UPI/IMPS directly (RBI digital-lending aligned).

DEMO VS PRODUCTION

Working end-to-end today; integrations swap behind flags.

- TODAY: deterministic DPI stubs + SMS stub + simulated lender handoff - full flow runs offline.
- READY: ULI adapter (OAuth2/HMAC/mTLS) and SMS provider scaffolds merged, inert until credentials land.
- 27 backend tests green; PWA ships at ~87 KB gzip (budget: 200 KB).
- TO GO: RBIH ULI onboarding, DLT SMS registration, DigiLocker eKYC, first NBFC pilot.

THE ASK

Partner with one NBFC. Switch three flags. Disburse.

ULI_MODE=live - OTP_MODE=sms - PARTNER_WEBHOOK_URL set

SetuCredit - the middleware bridge between consented data and lenders.
